*I don't know what I may appear to the world, but to myself
I seem to have been only a boy playing on the sea-shore,
and diverting myself in now and then finding a smoother
pebble or a prettier shell than ordinary, whilst the great
ocean of truth lay all undiscovered before me. [I. Newton]*

Students/Fellows Supervision

- 2017 *Valentina Tini* (Unipg) - Development of bioinformatics tools and analysis of data from microarray and RNAseq experiments in vivo and in vitro of acute myeloid leukemia with mutation of the NPM1 gene, treated with different drugs
- 2017 *Deepak Kumar Purusothaman* (Unipg) - Combined analysis on the genes considered essential for NPM1-mutated leukemia and drugs considered active (or inactive) specifically for this genetic subtype. A meta-analysis approach, from data available on the two different CRISPR screens drop out databases. The aim is to identify genes, or set of genes, belonging to pathways and cellular processes or known phenomena, which are essential only and specifically for NPM1-mutated AML cells, and can be druggable or represent sensitive targets to known drugs. These results could pave the way for the development of new research lines aimed at further understanding the biology of this particular subtype of leukemia.
- 2013 - 2016 *Stefano Brasca* (TIGET) - Lentiviral vectors are very proficient tools for gene therapy, due to their ability to integrate in the host genome. This makes them also useful to genetically mark and follow cells in vivo, but poses safety concerns. Thus, the analysis of vector integration sites in target cells is extremely important to address both biological and safety issues. We have set up several state of the art and new techniques to study vector integration and its impact on gene transcript structure and expression levels. The setup of a core activity with validated Standard Operating Procedures, dedicated computational infrastructures and data analysis pipelines has enabled the high-throughput integration site monitoring in different clinical trials and several other scientific projects at TIGET in a fast and cost-effective fashion. New wet-lab protocols for integration site retrieval and sequencing and bioinformatics research projects are being developed to approach the massive amount of samples and data generated, and to enable the correct interpretation of the physiological significance of differences detected in integration profiles.
